It is important to clear, that the data that appears of time execution parameters are handwritten data. I mean, the execution statistics of the queries have been collected one by one. Unfortunately, I did not find an option to return the execution statistics executing a file remotely. Being, CouchDB and MongoDB databases which the user connect by a port in localhost. There is no way to execute it. Nevertheless, CosmosDB is a cloud database, then it is possible to connect it with a server. But it was not possible because this way to connect it entails a billing statement. As a result, to proof the execution of the queries and the installation involved, the annex was created. In the annex, screenshots and some information are attached.
